MHP3 antigen and its fragments are useful in manufacturing a vaccine for treating c preventing a disease or disorder in an animal, especially pig, caused by M. hyopneumoniae infection e.g. enzoctic mycoplasma pneumonia. The mhp3-encoded proteins may be used as immunogens to generate antibodies which immunospecifically bind such an immunogen. The antibodies generated against the antigen are useful in diagnostic immunosasays, passive immunotherapy and generation of anti-diotypic antibodies. Mhp3 proteins may also be used in immunoasays, e.g. to detect or measure in a biological sample from a vaccinated or potentially infected test animal the presence of antibodies to the antigen, and thus to monitor the immune response and/or to diagnose infection of the animal.

The mhp3-encoded proteins may be used as immunogens to generate antibodies which immunospecifically bind such an immunogen. T antibodies generated against the antigen are useful in diagnostic immunoassays, passive immunotherapy and generation of anti-idiotypic antibodies. Mhp3 proteins may also be used in immunoassays, e.g. to detect or measure in a biological sample from a vaccinated or potentially infected test animal the presence of antibodies to the antigen, and thus to monitor the immune response and/or to diagnose

                                                              This sequence is a membrane protein designated M161Ag. Oligonucleotide probes for the CDNA were designed from putative N-terminal M161Ag pept sequences isolated from P93 cells. M161Ag can be used in the developme of a leukaemia treating agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAW22727 standard; Protein;

AAY81501 to AAY81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antiinflammatory properties. The sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be used in vaccines and in diagnostic assays. The nucleotide sequences can be used in vaccines and in diagnostic assays. The proteins and nucleotides can be useful for the detection and diagnosis of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection
                                                                                                                                                                                                                                                                                                                                                                                                  27-JUL-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The nucleic acid sequence encoding the Streptococcus pneumoniae protein can be useful in vaccines for inducing protective antibodies against Streptococcus pneumoniae, for treatment or prevention of infection e.g. pneumonia, office media or meningitis. Probes based on the nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents an antigenic polypeptide fragment isolated from Enterococcus faecalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated Enterococcus faecalis polynucleotides - used products for the detection of Enterococcus and for use in for prevention or attenuation of Enterococcus infection

                                                                                                                                                                                                                                                                                                                                                                                                                             This represents the Borrelia burgdorferi antigenic protein p39 beta. The antigenic protein p39 alpha is immunoreactive with mammalian Lyme borrelios serum. The Borrelia antigenic proteins p39 alpha and p39 beta are used in vaccines to protect against Lyme disease, as assay reagents to detect specific antibodles in the serum (diagnostic of Lyme disease), and to raise antibodles, either for diagnosis (by detecting the corresponding antigen) or in screening agents for ability to inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Lyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Borrelia burgdorferi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a protein isolated from Enterococcus faecalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for screening compounds to identify agonists and antagonists of E. faecalis protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        activity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           멼
                interleukin-X (IL-X), from an Epstein Barr virus (EBV)-carrying lymphoblastoid cell line. IL-X proteins can be used to enhance the growth of cells in vitro, or to grow primary human B cell cultures to facilitate proliferation of these cell lines, as therapeutics or prophylactics, as molecular weight standards, as inert proteins in an assay, or in the detection of antibodies that are immunoreactive with IL-X. Nucleotide sequences encoding the peptides could be used to produce recombinant peptides or they could be used as probes or primers for diagnostic and/or analytical polymerase chain reaction (PCR) procedures, or as DNA or RNA sizing standards. The present sequence represents the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         06-SEP-2001
                                                                                                                                                       The invention relates to a novel secreted autostimulatory factor, interleukin-X (IL-X), from an Epstein Barr virus (EBV)-carrying

            proteins was isolated by polymerase chain reaction (PCR) using the primer sequences given in AAQ34673-76. This DNA contained two open reading frames (ORF). It was therefore concluded that the P39 antigen which has been previously described is not one protein but two, 39-alpha and 39-beta. The P39 signal appears to be enhanced when both genes are present. Gene 1 encodes a 339 amino acid protein with a calculated molecular weight of 36.926 kD. The protein encoded by this gene which is reactive with serum from human Lyme patients. The ORF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleotides downstream of p39-alpha and encodes a protein of 341 amino acids (37.506 kD). The promoter located 5′ of p39-alpha appears to be present with classic -10 and -35 regions whereas p39-beta lacks a recognisable promoter sequence. Both genes have putative ribosomal binding sites immediatly 5′ to the start codons and each is terminated with a TAA codon. Comparing the gene sequences of p39-alpha and p39-beta indicates that these genes have 62% similarity. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers. Disclosure; Page 36-39; 69pp; English.

CC proteins was isolated by polymerase chain reaction (PCR) using the proteins was isolated by polymerase chain reaction (PCR) using the proteins was isolated by polymerase chain reaction (PCR) using the protein base been previously described is not NA contained two open cadding frames (ORF). It was therefore concluded that the P39 antigen which has been previously described is not no protein but two, 39-alpha and 39-beta. The P39 signal appears to be enhanced when both genes and 39-beta. The protein encoded by this calculated molecular weight of 36,926 kD. The protein encoded by this calculated molecular weight of 36,926 kD. The protein encoded by this calculated in the Calculated page of P39-alpha and encodes a protein of 341 amino acid gene 2 has been designated p39-beta. This genes ORF starts 116 calculated (37.506 kD). The promoter located 5' of p39-alpha appears to be present with classic -10 and -35 regions whereas p39-beta lacks a recognisable promoter sequence. Both genes have pate the pate and p39-alpha patend number. For further information please visit hongoing US granted patent numbers. For further information please visit the Derwent calculated by site at www.derwent.com/dwpi/updates/ntis_us.html.)

basic membrane protein A (bmpA) - Lyme disease spirochet:
N;Alternate names: antigen P39; membrane lipoprotein A
C;Species: Borrella burgdorferi (Lyme disease spirochete)
C;Date: 13-Feb-1998 #sequence_revision 13-Feb-1998 #text_change 29-Sep-1999
C;Accession: F70147; 140289; 140241
